Euclid Contest

Concours Euclide

The Centre for Education in Mathematics and Computing is pleased to announce the results of the 2025 Euclid Contest. Our congratulations go to all who participated.

Le Centre d'éducation en mathématiques et en informatique a d'annoncer les résultats du Concours Euclide 2025. Nos félicitations vont à tous les participants de cette année.

Key statistics:

- Average = 54.8
- Medal Cutoff = 54
- Certificate of Distinction Cutoff = 68

Statistiques principales:

- Moyenne = 54,8
- Note de passage: Médaille du championnat de l'école = 54
- Note de passage: Certificat de distinction = 68

Note: The names of some participants with sufficiently high scores do not appear on the Honour Roll. In each case, this is because the participants were either unofficial or opted out of having their name displayed. The CEMC does not change these statuses after the fact.

Note: Les noms de certaines personnes participantes ayant obtenu des scores suffisamment élevés ne figurent pas dans le palmarès présenté. Dans chaque cas, cela s'explique par le fait que ces personnes participantes n'étaient pas officielles ou qu'elles n'ont pas souhaité que leur nom figure sur le palmarès. Le CEMI ne modifie pas ces statuts après coup.

Specific Comments

1. Average: 9.7
This question was generally well done.
2. Average: 9.1
This question was generally well done. In part (a), many students arrived at $\sqrt{5} < k < \sqrt{12}$ but did not state that $k = 3$. In part (b), most students did not take an algebraic approach and ended up making arithmetic errors. In part (c), most students used a similar approach to the posted solution.
3. Average: 8.3
This question was also generally well done. In part (a), the most common error involved a flipped sign leading to an answer of +4 instead of -4. In part (b), most students were able to find the intercepts or the leading coefficient, but many students had trouble finding the correct quadratic. There were many well-written solutions to part (c). The most common errors involved incorrect manipulation of fractions.
4. Average: 7.2
Most students knew what to do in part (a), but many forgot to compute the actual distance travelled. Many students had a valid approach for part (b). Students who used similar triangles often did not provide justification for similarity. Students who used trigonometry often ended up rounding and getting an inexact answer. Students who used coordinates were generally successful.

5. Average: 4.8

In part (a), students who used Solution 1 tended to get the correct answer. Students who attempted to count by considering cases often had slightly incorrect answers for a variety of reasons like thinking $a = c = 30$ or assuming $b \leq 20$. Many students made good progress on part (b). One common error was to reject $\cos \theta = 0$, incorrectly claiming that 2, 2, 2 is not a geometric sequence. Some students incorrectly rejected $-\frac{2\sqrt{2}}{3}$ or did not simplify $\cos(\sin^{-1}(\frac{1}{3}))$.

6. Average: 4.7

The most common errors in part (a) were thinking there are 12 possible equilateral triangles (there are 4), or forgetting/ignoring the equilateral triangles entirely. Part (b) had many, many different correct solutions. Plenty of students had a good plan but got lost in the calculations. This was especially true for students who used a solution with radicals or made an unlucky choice of which length to solve for first. We saw no successful solutions that used line segment CP . Such attempts often came with an incorrect assumption (for example, assuming CP and AB are parallel). Some students also had correct solutions but used decimal approximations. Inexact answers did not earn full marks.

7. Average: 6.1

Most students either answered part (a) correctly or seemed to have no idea how to approach it. We will note that some students attempted to find an explicit algebraic expression for $f(x)$ and $g(x)$ assuming they were linear, which does not work. Others interpreted $f^{-1}(x)$ as $\frac{1}{f(x)}$. Most mistakes in part (b) involved incorrect use of logarithm rules, not realizing that the input of a logarithm must be positive, or incorrectly claiming that the output of a logarithm must be positive.

8. Average: 2.0

Many students did not know how to start part (a). Other students had an idea of what to do, but a computation error led to one of the probabilities being less than 0 or greater than 1. Of course, this type of error was bound to lead to an incorrect answer even if the calculations that followed were correct. Of the students who found the correct answer, many did not show how they solved the system of equations. Showing how this system was solved was required to earn full marks on this question. As with part (a), many students did not know how to get started on part (b). Most students who tried to use trial and error or look for a pattern usually missed some pairs. Some students also incorrectly assumed that $m - n$ must itself be a palindrome. A small number of correct solutions used modular arithmetic.

9. Average: 1.6

Most students that attempted Question 9 were able to use the definition of an arithmetic sequence to show that $x = 1$ is a root of the given polynomial in part (a). Many students also correctly determined the relevant quadratic factor of the polynomial, eliminating some of the parameters, to form a basis for solutions to parts (b) and (c). Many of these students arrived at the correct roots in part (b); however, there was often missing justification for how these roots were found and/or why there was a unique answer for the roots. Correct and complete solutions to part (c) were less common and generally took an approach similar to the one outlined in the posted solutions.

10. Average: 1.0

When attempted, part (a) was very well done. In part (b), it was common to identify the importance of the three corner coins when arguing that there is not a sequence of turns that results in a win. Careful and compelling justification was needed to earn the remaining marks for this part. There were students who identified a pattern describing for which values of n it is possible to win the game, but few students earned marks for the part (c) by rigorously justifying their answer. In parts (b) and (c), some students tried to concisely argue that in order to win the game, the total number of coins must be a multiple of 3 because 3 coins are flipped per move. This reasoning is faulty because it assumes that each coin must be flipped exactly once, which is not true.

Remarques particulières

1. Moyenne: 9,7

Cette question a été généralement bien réussie.

2. Moyenne: 9,1

Cette question a aussi été généralement bien réussie. Dans la partie (a), de nombreuses et nombreux élèves sont arrivés à $\sqrt{5} < k < \sqrt{12}$ mais n'ont pas énoncé que $k = 3$. Dans la partie (b), la plupart des élèves n'ont pas adopté une approche algébrique et ont fini par faire des erreurs arithmétiques. Dans la partie (c), la plupart des élèves ont utilisé une solution similaire à la solution posée.

3. Moyenne: 8,3

Cette question a aussi été généralement bien réussie. Dans la partie (a), l'erreur la plus fréquente consistait à inverser le signe, conduisant à une réponse de $+4$ au lieu de -4 . Dans la partie (b), la plupart des élèves ont réussi à trouver les ordonnées ou le coefficient principal, mais beaucoup ont eu du mal à trouver la quadratique correcte. De nombreuses solutions de la partie (c) ont été bien rédigées. Les erreurs les plus fréquentes concernaient la manipulation incorrecte de fractions.

4. Moyenne: 7,2

La plupart des élèves savaient ce qu'il fallait faire dans la partie (a), mais beaucoup ont oublié de calculer la distance réelle parcourue. De nombreuses et nombreux élèves ont adopté une approche correcte pour la partie (b). Les élèves qui ont utilisé des triangles semblables n'ont souvent pas justifié la similitude. Les élèves qui ont utilisé la trigonométrie ont souvent fini par arrondir et obtenir une réponse inexacte. Les élèves qui ont utilisé les coordonnées ont généralement réussi.

5. Moyenne: 4,8

Dans la partie (a), les étudiants qui ont utilisé la solution 1 ont eu tendance à obtenir la bonne réponse. Les élèves qui ont essayé de compter en considérant les cas ont souvent obtenu des réponses légèrement incorrectes pour diverses raisons, par exemple en pensant que $a = c = 30$ ou en supposant que $b \leq 20$. De nombreuses et nombreux élèves ont bien progressé dans la partie (b). Une erreur fréquente a été de rejeter $\cos \theta = 0$, affirmant à tort que $2, 2, 2$ n'est pas une suite géométrique. Certaines et certains élèves ont rejeté à tort $-\frac{2\sqrt{2}}{3}$ ou n'ont pas simplifié $\cos(\sin^{-1}(\frac{1}{3}))$.

6. Moyenne: 4,7

Les erreurs les plus fréquentes dans la partie (a) étaient de penser qu'il y a 12 triangles équilatéraux possibles (il y en a 4), ou d'oublier/ignorer complètement les triangles équilatéraux. La partie (b) comportait un très grand nombre de solutions correctes différentes. De nombreuses et nombreux élèves avaient un bon plan mais se sont perdus dans les calculs. C'est particulièrement vrai pour les élèves qui ont utilisé une solution avec des radicaux ou qui ont eu la malchance sur le choix de la longueur à résoudre en premier. Nous n'avons vu aucune solution réussie utilisant le segment de droite CP . Ces tentatives étaient souvent accompagnées d'une hypothèse incorrecte (par exemple, en supposant que CP et AB sont parallèles). Un certain nombre d'élèves avaient également des solutions correctes mais utilisaient des approximations décimales. Les réponses inexactes n'ont pas obtenu tous les points.

7. Moyenne: 6,1

La plupart des élèves ont soit répondu correctement à la partie (a), soit n'ont pas semblé savoir comment l'aborder. On notera que certains élèves ont tenté de trouver une expression algébrique explicite pour $f(x)$ et $g(x)$ en supposant qu'ils étaient linéaires, ce qui ne fonctionne pas. D'autres ont interprété $f^{-1}(x)$ comme $\frac{1}{f(x)}$. La plupart des erreurs dans la partie (b) impliquaient une utilisation incorrecte des règles du logarithme, ne réalisant pas que l'entrée d'un logarithme doit être positive, ou affirmant à tort que la sortie d'un logarithme doit être positive.

8. Moyenne: 2,0

De nombreuses et nombreux élèves ne savaient pas comment commencer ce problème. D'autres avaient une idée de ce qu'il fallait faire, mais une erreur de calcul a fait que l'une des probabilités était inférieure à 0 ou supérieure à 1. Bien entendu, ce type d'erreur devait conduire à une réponse incorrecte même si les calculs qui suivaient étaient corrects. Parmi les élèves qui ont trouvé la bonne réponse, beaucoup n'ont pas montré comment ils avaient résolu le système d'équations. Pour obtenir la totalité des points à cette question, il fallait montrer comment ce système avait été résolu. Comme pour la partie (a), de nombreuses et nombreux élèves n'ont pas su comment s'y prendre pour résoudre la partie (b). La plupart des élèves qui ont essayé de procéder par essais et erreurs ou qui ont cherché un modèle ont généralement manqué des paires. Certaines et certains élèves ont également supposé à tort que $m - n$ devait être lui-même un palindrome. Un petit nombre de solutions correctes ont utilisé l'arithmétique modulaire.

9. Moyenne: 1,6

La plupart des élèves qui ont répondu à la question 9 ont pu utiliser la définition d'une suite arithmétique pour montrer que $x = 1$ est une racine du polynôme donné dans la partie (a). De nombreux élèves ont également déterminé correctement le facteur quadratique pertinent du polynôme, en éliminant certains paramètres, afin de former une base pour les solutions des parties (b) et (c). Bon nombre de ces élèves sont parvenus à des racines correctes dans la partie (b) ; cependant, il manquait souvent une justification de la façon dont ces racines ont été trouvées et/ou de la raison pour laquelle il y avait une réponse unique pour les racines. Les solutions correctes et complètes à la partie (c) étaient moins courantes et adoptaient généralement une approche similaire à celle décrite dans les solutions publiées.

10. Moyenne: 1,0

Lorsqu'elle a été tentée, la partie (a) a été très bien réussie. Dans la partie (b), il était courant d'identifier l'importance des trois pièces dans les sommets lorsqu'on affirmait qu'il n'y avait pas de séquence de tours qui aboutissait à une victoire. Une justification soigneuse et convaincante était nécessaire pour obtenir les points restants pour cette partie. Des élèves ont identifié un modèle décrivant les valeurs de n pour lesquelles il est possible de gagner le jeu, mais peu d'élèves ont obtenu des points pour la partie (c) en justifiant rigoureusement leur réponse. Dans les parties (b) et (c), certains élèves ont essayé d'argumenter de manière succincte que pour remporter le jeu, le nombre total de pièces doit être un multiple de 3 parce que 3 de pièces sont retournées par coup. Ce raisonnement est erroné car il suppose que chaque pièce doit être retournée exactement une fois, ce qui n'est pas vrai.
